

Cold Front Technologies Asia, Inc. was started by Silicon Valley entrepreneurs and Philippine refrigeration industry veterans in 2016. It was founded on the idea of combining the innovative and progressive attitude of Silicon Valley with decades of experience and expertise in commercial and industrial refrigeration systems.

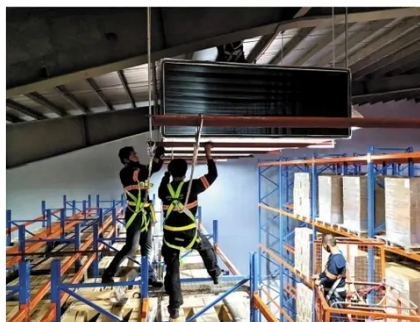

Since its inception, Cold Front has expanded its offerings to include ventilation/air-conditioning, cold storage, and automation systems.

With its focus on innovation, Cold Front is the first company to install the new Water Loop Refrigeration System in the Philippines and is one of the pioneers in Asia using this ground-breaking technology. Cold Front is also one of the early adopters of R290 — a natural, more efficient, non-toxic, propane-based refrigerant -- in refrigeration.

In 2020, Cold Front successfully installed the first Water Loop System using all R290 refrigerants at Royal Duty Free Shops in Subic. This new system was installed as a retrofit project and Cold Front was able to do so with zero downtime or store closure.

In the past 2 years of the system's operation, Royal Duty Free Shops has seen a 36% savings in energy consumption from their previous R404 remote system and 18.5% savings from their previous R404 plug-in units.

Cold Front is proud to be part of the Cold Chain Innovation Hub as it continuously strives to set the industry bar for innovation, quality, and environmental responsibility.
